

Waterfall Model

Waterfall model

- (1) The feedback loops permits modifications to be made to design documents, the software project management plan, and even the specification document, if necessary.
- (2) No phase is complete until the documentation for that phase has been completed and the products of that phase has been approved by the SQA group.
- (3) Once the client has accepted the product, any changes constitute maintenance.
- (4) Inherent in every phase is testing.

Software configuration is the entire set of documents, including specification document, design document, code, user manual, operations manual, etc.
